The First Light Machine

- The James Webb Space Telescope is an infrared telescope with a 6.5m primary mirror.
- GSFC manages the project and Northrop Grumman Aerospace Systems is the prime contractor.
- JWST will observe
 - First luminous glows after the Big Bang
 - Formation of solar systems capable of supporting life on planets like Earth
 - Evolution of our own Solar System
- There are 4 science instruments mounted in the Integrated Science Instrument Module (ISIM), which was designed and integrated by GSFC staff independent of the JWST project office.
- SGT and our partners on the MSES IIA contract have supported GSFC's management of JWST and development and delivery of ISIM in a myriad of ways. Our analysis support using FEMAP is one small part of the work we have been honored to do in concert with NASA/GSFC.

Launch and Orbit

- JWST will be launched via an Ariane V from French Guiana.
- For thermal and optical reasons JWST cannot operate in low-Earth orbit. It will orbit about the LaGrange point L2, 1.5 million km from Earth.

Major Elements

THE JAMES WEBB SPACE TELESCOPE

FEMAP's role on JWST

- Traditional Loads modeling
- Design and testing of the ISIM
- On-orbit stability of the observatory — Thermal and Jitter

Developing Models

Model Validity Checks

- GSFC has a long history with NASTRAN but we don't trust models
- Checks are done on all models - a requirement written into the documents defining the analysis process for the project
 - Grounding and free rigid movement
 - Mechanism checks and rigid/flexible modal separation
 - Free thermal expansion
- These checks build confidence that models are usable for further analysis
- FEMAP is used to review these results

<http://femci.gsfc.nasa.gov/validitychecks/index.html>

ISIM Structure

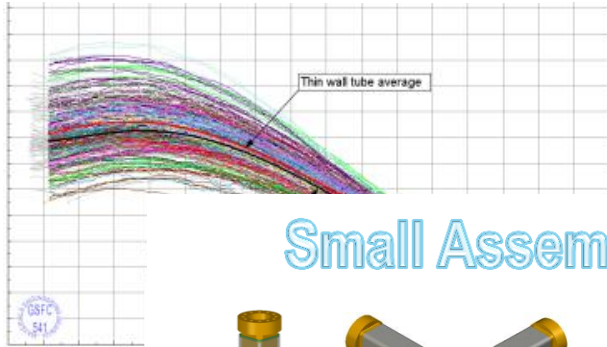

- GSFC developed the ISIM structure
 - Houses 4 science instruments in a strong, stable truss assembly
 - Operating temperature is 40K with variations of about 1K
 - Structure is 2m x 2.3m x 2.3m and weighs 860kg
- Status
 - Design, build and bench structure proof testing is complete
 - Populated with all instruments
 - Completed 2 cryogenic proof tests and 1 system operational test
 - Another operational test is scheduled for June 2014

Global to Local

JWST Model Building

- Thermal Distortion
 - Used to predict thermally-induced wavefront error during observing periods
 - Component models from manufacturers
 - NGAS and GSFC collaborate on building and validating the observatory model
- Final models are huge
 - 5.2M Elements (mostly solids)
 - 27 MDOF
 - On-orbit models tend to exclude parts not important to wavefront error
- Deployed Dynamics
 - Used to predict mechanically-induced wavefront error during observations
 - Component models from manufacturers
 - NGAS and GSFC collaborate on building and validating the observatory model
- Analysis models make substantial use of Craig-Bampton reduction of TD models
- Substantial effort is put into avoiding grounding and other mathematical errors

Modeling the Tests

Testing the Hardware

- An engineering effort isn't complete until it is proven that hardware meets the requirements.
- ISIM has completed multiple strength and cryogenic proof tests.
- JWST will undergo testing against structural requirements.
- Operational stability requirements can't be proven by test; we will prove by analysis.

ISIM Strength Proof Testing

ISIM Performance Predictions

Cryogenic Test Thermal Model

Cryogenic Test Structural Model

15

ISIM Test Results vs. Model

- ISIM TD testing was successful
 - These compare test translations from PG to models
 - Models with static MUF and stochastic predictions are both shown

JWST Strength Testing

- GSFC and NGAS are both procuring new vibration test equipment
- Analysis performed to show the required capacity
- Will model random and sine vibrate testing for strength and workmanship as part of pre-test planning
- Will correlate the model post-test

Deployed Dynamics Testing

- JWST deployed dynamics modal correlation will be done at room temperature
 - Cryo damping effects are well understood from prior tests
 - Not a requirements proof test
 - Flight model will be adjusted based on this test
- We have developed a model of this test
 - Once the model is well tuned to the test, it is then extracted and used for operational DD requirement verification by analysis

51

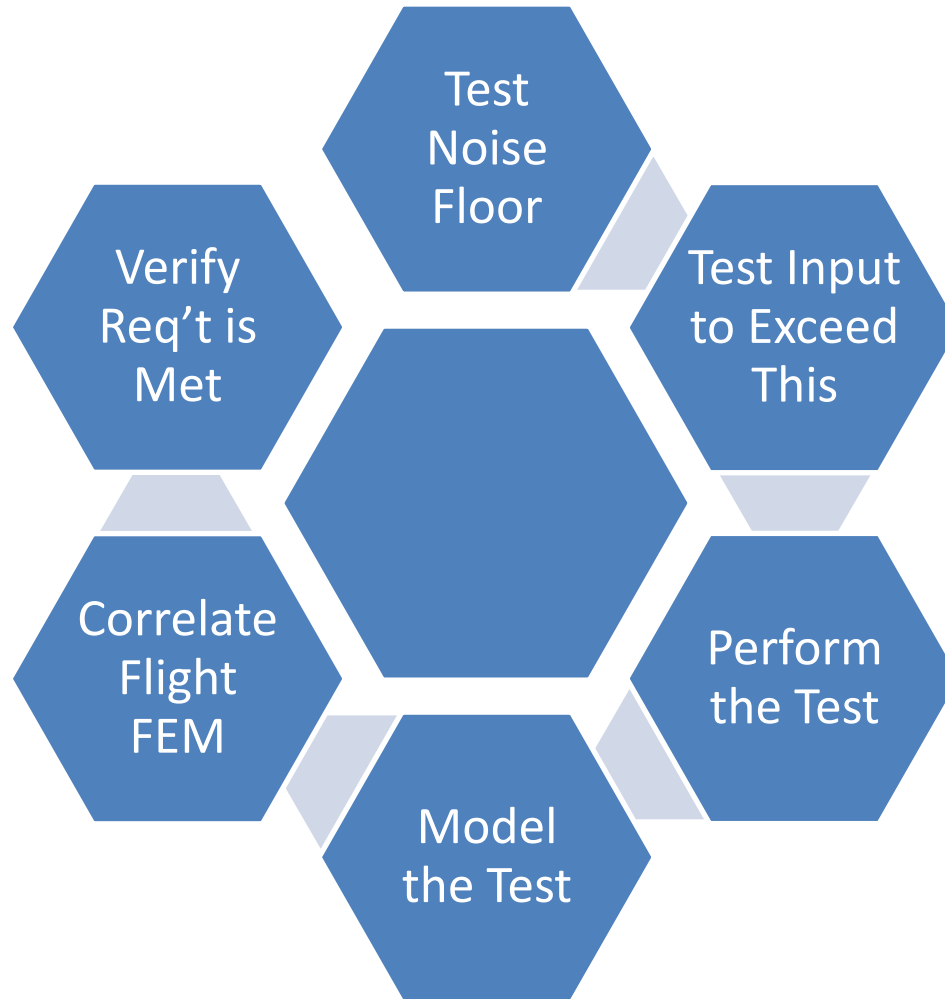

Transportation Modeling

- After partial assembly of the structure it will be transported to JSC for testing. It will also be transported after full assembly.
- Nelson Manufacturing created the trailer, which was modeled by SGT staffers to ensure the transportation loads were acceptable.
- Transit environments include trucking, C5, and ship. GSFC collected vibration data from the ship as an analysis input.

FEMAP Specific Benefits

- API's were developed as needed
 - Extracting displacement results from massive models
 - Summing strain energy by Group expedited design improvement
 - Access to the full 16-digit grid locations assured completely coincident grids on export, critical when results are in nanometers
 - Modal data exported for further processing in MATLAB
 - Automated Global-Local Modeling
- Efficient results reading through attachment of OP2 files - saved as much as an hour on every modal run
- Limited property visualization (bar/beam only) is beneficial
- Dongle-based licensing allows for use of the software without internet access

Conclusion

- JWST is making excellent strides toward completion and launch in 2018
- FEMAP is a part of the effort to make sure we successfully observe the first light of the universe
- There is still much to be analyzed between now and the delivery of the telescope
- Questions?
